BELT TERMINOLOGY

TRACTION DRIVE BELTS

Primary Belt - Engine output to variator input.

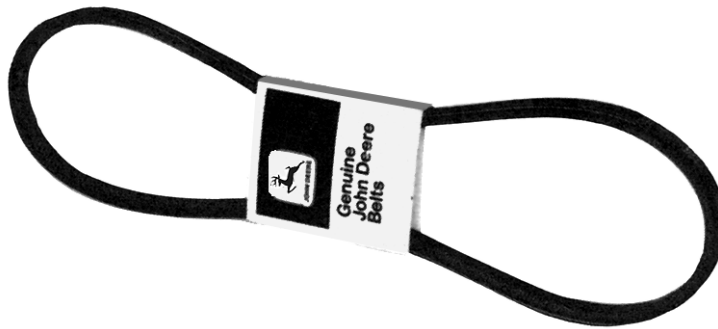

Secondary Belt - Variator output to transmission input.

MOWER DRIVE BELTS

Primary Belt - Engine output to mower jacksheave.

Secondary Belt - Mower jacksheave to mower blade spindles.

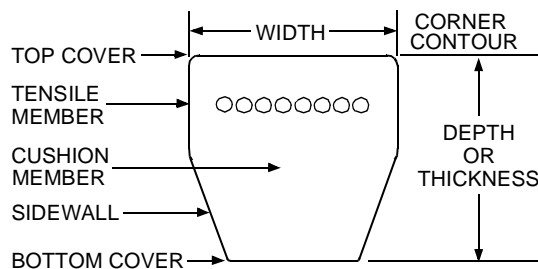

INTRODUCTION

This book gives you belt product information, part numbers, and a list by size for most John Deere consumer and commercial equipment.

DESIGN

The illustration below shows important areas of a typical V-belt cross section. Each area plays an important role in belt performance.

The top section of the belt is the tension section. It is rubber and stretches as the belt forms around the sheave.

The bottom section is called the compression section because it compresses when wedged into and shaped around the sheave.

The center section of the belt is the strength section. It neither compresses nor stretches, but the cords located in this area give the belt its tensile strength. Without these cords, a V-belt would be pulled apart.

The complete belt is covered by a tough fabric and rubber which protects the inner parts.

NOTE: Some V-belts have a corrugated underside for greater flexibility.

MAINTENANCE

TENSION—Too little tension causes slippage or slip-and-grab, causing the belt to break. If the belt does not break, slip will cause excessive cover wear, burned spots, and overheating.

Too much tension causes belt overheating and excessive stretch as well as damage to drive components, such as sheaves and shafts. The extra tightness will also place heavier loads on the bearings.

Remember that V-belts should ride on the sides of standard sheaves, not on the bottom of the groove.

WATCH THE TENSION ON A NEW BELT DURING THE FIRST 24 HOURS OF OPERATION—This is when the initial seating and stretch occurs.

ALIGNMENT—Sheave alignment is important. Be sure that the shafts are parallel and the belt aligns with each sheave.

TROUBLESHOOTING V-BELT WEAR

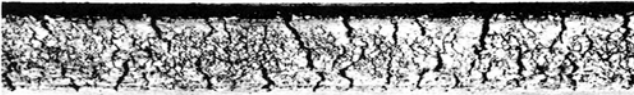

①

BASE CRACKING

⑤

SLIP BURN

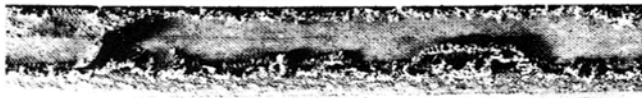

②

BASE CRACKING

⑥

GOUGED EDGES

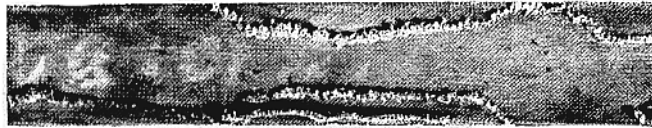

③

FABRIC RUPTURE

⑦

RUPTURED CORDS

④

COVER TEAR

⑧

WORN SIDES

Symptom

Probable Cause

Solution

1. Base cracking

Defective belt (little side wear).

Replace belt.

2. Base cracking

Damaged belt (badly worn sides).

Replace belt.

3. Fabric rupture

Prying belt onto sheave. Worn sheaves.
Belt too tight.

Loosen belt tighteners before installing belt. Do not tighten belt too much. Also, replace belt.

4. Cover tear

Belt coming into contact with some part on machine.

Find interference and eliminate it.

5. Slip burn

Belt operated too loose. When operating under load, grabs and snaps.

Tighten belt properly. Also, replace belt.

6. Gouged edge

Damaged sheave or interference from some part on machine.

Check condition of sheaves and check for interference. Also, replace belt.

7. Ruptured cords

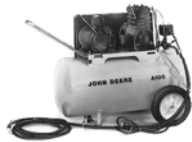

Driven sheave locked and drive sheave burned area of belt because belt would not rotate with sheave.

Avoid overloading drive and lubricate bearings to prevent bearing seizure. Also, replace belt.

8. Worn sides

Long operation without enough tension.

Check and tighten belt regularly. Also, replace belt.

AIR COMPRESSORS

MACHINE/MODEL	SERIAL NO.	PART NO.	DESCRIPTION
A75		LG48-370	Main, V-Belt
A100	(-SEP 80) (OCT 80-)	TY4831 PT4970	Main, V-Belt Main, Poly-V Belt
